How to Create an Add-On Domain in cPanel

This demo assumes you've already logged into cPanel..

Lets use the **ADD-ON DOMAIN** feature to add another domain name to this account.

Scroll down.

Click the **ADD-ON DOMAIN** link.

There are currently no add-on domain names listed, lets create one!

Enter the new domain name in the **NEW DOMAIN NAME BOX**.

Enter the directory name in your main account where your new domain will be pointing. Then enter a password for this new add-on domain. Reenter your password and click the **ADD DOMAIN** button.

That's it! The new add-on domain (demo1234.com) has been created and its website files should be uploaded to the abc123.com/demo1234 directory. A new FTP account has also been created for this domain.

Click the **GO BACK** link, then click the **HOME** icon.

Scroll down and then click the **FTP ACCOUNT** link. Scroll down and find your new FTP account that was automatically created for your new domain demo1234.com.

To remove a domain, go back to the **ADD-ON DOMAIN** screen. Click the **REMOVE** button, then click **YES**. The add-on domain and its FTP account have been removed.

You now know how to set up add-on domains in your account.
